

UltraSIL Polymer-Housed VariSTAR Type U2 Surge Arrester for Systems through 275 kV IEC 10-kA; Line Discharge Class 2

Figure 1.
UltraSIL Polymer-Housed VariSTAR Class 2 Surge Arrester family.

EATON

Powering Business Worldwide

General

Eaton's Cooper Power series UltraSIL™ Polymer-Housed VariSTAR™ Type U2 Surge Arresters offer the latest in metal oxide varistor (MOV) technology for the economical protection of medium-voltage class power and substation equipment. These arresters are gapless and are constructed of a single series column of 51 mm diameter MOV disks. The arrester is designed and tested to the requirements of the International Electrotechnical Commission Standard IEC 60099-4, and is available in ratings suitable for the transient overvoltage protection of electrical equipment on systems through 275 kV.

The UltraSIL Polymer-Housed U2 Surge Arrester incorporates the industry recognized superior polymeric material—Silicone Rubber.

The advantages of polymer-housed arresters—reduced size and weight and enhanced safety—have been refined in this next generation Cooper Power series UltraSIL Polymer-Housed U2 Surge Arrester from Eaton.

Table 1. UltraSIL Housed Type U2 Class 2 Ratings and Characteristics

Arrester Characteristic	Rating		
Arrester Voltage Ratings, Ur	3-240 kV		
Rated Discharge Energy	Single Impulse	Double Impulse*	
	kJ/kV of Uc	3.4	5.3
	kJ/kV of Ur	2.7	4.2
System Frequency (Hz)	50/60		
Classifying Current (kA)	10		
High Current Withstand** (kA)	100		
Pressure Relief Rating (kA rms sym.)	3-108 kV	40	
	120-240 kV	63	
Cantilever Strength (Nm)	Ultimate	MPSL (Static)***	
	U2 (3-108 kV)	1,150	460
	U2 (120-240 kV)	1,700	680

* Double impulse rating assumes a two shot energy discharge within one minute.

** High current, short duration withstand (100 kA, 4/10 μ s)

*** MPSL—Maximum permissible service load (static) or maximum working load is 40% of the ultimate.

Construction

The unique construction of UltraSIL Polymer-Housed Class 2 Arresters begins with world class Metal Oxide Varistor (MOV) disks produced at our manufacturing facility in Olean, NY. By manufacturing our own disks we maintain a strict quality control over the entire production process, from initial raw material inspection to final physical and electrical testing of each disk. In addition, by controlling the manufacturing process of both disks and arresters, we achieve the optimal combination. Eaton produces MOV disks of unsurpassed quality through continuous improvements in disk formulation and manufacturing technology. The end result is a long history of in-service use with outstanding durability and protective capability.

Arrester production begins by stacking glass-collared MOV disks in series with aluminum end electrodes. Our proprietary process wraps the assembly with a high-strength woven fiberglass-reinforced epoxy composite. When cured, the arrester module is capable of withstanding high electrical and cantilever load conditions.

The UltraSIL silicone rubber housing utilizes an interference fit and is bonded onto the internal module to form a solid, void-free, high-dielectric strength insulation system. Once the housing is in place, each arrester must pass a strict series of electrical tests to insure the highest level of in-service performance.

The silicone rubber housing results in lighter weight than similarly rated porcelain housed arresters. The silicone rubber housing is also less sensitive to physical damage than porcelain. Also, when compared to other polymeric housing materials, silicone rubber generates significantly lower external power losses under contaminated conditions.

Features

The UltraSIL silicone rubber housing was chosen for its superior insulation performance when compared to other polymeric housing materials. Long term environmental testing has verified the superiority of UltraSIL silicone rubber when compared to other polymeric insulating materials.

Independent laboratory tests have verified the superior water repellent behavior of silicone rubber, which is responsible for the lower external power losses, higher resistance to UV degradation and surface tracking, superior performance in contaminated environments, and other important insulating properties. Also, UltraSIL silicone rubber has been proven not to support biological growth and is nonflammable.

The basic silicone rubber housed arrester can be customized with a variety of terminal and mounting options which allow users to select the features that meet their application needs. Customers who require longer creepage housings can easily select a different housing option through the catalog numbering system. See pages 7-10 for a complete list of available options.

Operation

The operation of the VariSTAR arrester is typical of gapless metal oxide arresters. During steady state conditions, line-to-earth voltage is continuously across the arrester terminals. When overvoltages occur, the VariSTAR arrester immediately limits the overvoltage to the required protective level by conducting only the necessary level of surge current to earth. Upon passage of the overvoltage condition, the arrester returns to its initial condition, once again conducting only minimal leakage current.

UltraSIL Polymer-Housed VariSTAR Class 2 Arresters are ideal for the protection of critical substation apparatus in areas of moderate lightning incidence and for protection against

switching surges generated on transmission systems. Pressure relief tests have been conducted in accordance with IEC 60099-4 to demonstrate the UltraSIL Polymer-Housed VariSTAR Class 2 Arrester's ability to withstand fault currents for specific durations.

Design testing

The housing material, internal components and hardware work as a system to withstand years of exposure to environmental extremes. To assure a superior level of performance, the components and the assembled arrester unit have been subjected to a testing program that accurately simulates years of exposure to field conditions. Tests include:

IEC 600994 testing - full certification to performance requirements by an independent laboratory has been completed. A certified test report is available upon request.

Additional design verification of the UltraSIL Housed VariSTAR Class 2 Arrester includes testing for:

- Ultraviolet withstand
- High voltage dielectric integrity
- Wet arc tracking resistance
- Thermal shock
- Coefficients of expansion and materials compatibility
- Cantilever strength
- Terminal torque

For detailed reports please contact your Eaton sales representative.

Routine tests

A complete automated production test program ensures a quality product. Each metal oxide varistor receives a series of electrical tests. Quality is further demonstrated by tests performed to destruction on samples from every batch of varistors.

Figure 2. Cutaway illustration of UltraSIL Polymer-Housed VariSTAR Class 2 Arrester.

Routine tests on the varistor disks performed in accordance with IEC 60099-4:

- Physical inspection
- Residual voltage test
- V_{ref} at 6 mA
- Watts loss at $1.05 \times U_C$
- Measured at ambient temp.
- Transmission line discharge
- Energy test
- Batch high-current, short-duration
- Batch thermal stability test
- Batch aging test

Routine tests on each fully assembled UltraSIL Polymer-Housed VariSTAR Class 2 Arrester, per IEC 60099-4.

- Physical inspection
- Partial discharge test
- Reference voltage test
- Watts loss test

General application recommendations

The rating of an arrester is the maximum power-frequency line-to-earth voltage at which the arrester is designed to pass the IEC operating duty test. Table 2 provides a general guide for the selection of the proper arrester for a given system voltage. Eaton application engineers are available to make specific system application recommendations.

Selection of arrester rating

In arrester rating selection it is preferable to determine the lowest arrester rating that will ensure satisfactory operation. This is the optimum solution because the arrester selected will not only provide the greatest margin of insulation protection but also be the most economical choice.

Increasing arrester ratings above the minimum increases the likelihood of the arrester surviving varying system conditions but compromises the protection of equipment insulation. Table 2 lists VariSTAR U2 arrester ratings commonly used on various three-phase systems.

Rating selection should begin with consideration of the maximum system operating voltage. The maximum power frequency voltage expected under normal system conditions (expressed line-to-earth) should not exceed the selected arrester's continuous operating voltage (U_C).

The temporary overvoltage (TOV) capability of the VariSTAR U2 arrester is shown in Figure 3. The curves indicate the arrester's ability to withstand abnormal system power frequency (sinusoidal) overvoltages for various durations. The values shown assume that the arrester has been energized at COV (U_C) prior to an overvoltage event, that the arrester is in an ambient temperature of 60° C, and that after the overvoltage durations shown, demonstrate that the arrester will thermally recover when once again energized at COV (U_C).

The voltage withstand capability for application on ungrounded systems after IEC high current duty is 1.07 per unit of COV (U_C) for 24 hours. For ungrounded systems utilizing high impedance or resonant grounding and other systems where the line-to-earth voltages exceed this stated TOV capability, arresters having a COV (U_C) equal to line-to-line voltage may be required.

For non-sinusoidal transient voltages caused by system switching operations a transient network analyzer (TNA) study is recommended; Eaton's engineers are available to make these studies. Figure 3 also illustrates the arrester's TOV capabilities with and without prior switching surge duties of up to a maximum capability of 3.4 kJ/ kV of COV (U_C)-single impulse and 5.3 kJ/kV of COV (U_C)-double impulse.

Table 2. Arrester ratings commonly used on 3-phase systems

System Voltages L-L (kV)		Arrester Ratings (kV)	
Nominal	Max	Grounded Circuits	High-Impedance/ Ungrounded Circuits
3.3	3.7	3	6
6.6	7.3	6	9
10.0	11.5	9	12-15
11.0	12.0	9-10	12-15
16.4	18.0	15.0	18-21
22.0	24.0	18-21	24-27
33.0	36.3	27-30	36-39
47.0	52.0	39-48	54-60
66.0	72.0	54-60	66-84
91.0	100	78-84	90-96
110	123	96-108	120-135
132	145	108-120	132-144
155	170	132-144	162-172
220	245	180-198	204-240
275	300	216-240	-

Figure 3. Temporary Overvoltage Capability of VariSTAR U2 Surge Arresters.

Note: The 24 hour TOV with prior duty is 1.07 per unit of U_C .

To assure proper application the following information is normally required:

1. Maximum system operating voltage.
2. System grounding conditions.
 - A. For four-wire circuits, grounding conditions depend upon whether the system is multi-grounded, whether it has neutral impedance, and whether common primary and secondary neutrals are used.
 - B. For three-wire circuits, grounding conditions depend upon whether the system is solidly grounded at the source, grounded through the neutral impedance at the source grounded through transformers, or ungrounded.

Where unusual conditions exist (high ground resistance, high capacitive load, unusual switching surge duty, etc.), the following supplementary information is required:

- Type of unusual condition
- BIL of equipment and separation distance to protected equipment
- Type of construction (phase spacing, length of line, conductor size, etc.)
- Grounding and phase-sequence components of source impedances
- Phase-sequence components of load impedances
- Available fault current
- Potential for loss of neutral earthing during system events

Performance and protective characteristics

Table 4, "Protective Characteristics of the UltraSIL Polymer-Housed Varistar U2 Surge Arrester" displays the Arrester Rating (U_p), Continuous Operating Voltage (U_c) and the guaranteed protective characteristics. The Steep Current Impulse protective level is the maximum residual voltage for a 10 kA impulse current that crests in one microsecond. Lightning Impulse Residual Voltages represent the maximum protective levels exhibited by the arrester when discharging lightning currents of the standard 8/20 microsecond waveshape. The maximum Switching Impulse Residual Voltages are based on a switching surge current having a time to crest of 30 microseconds. For all ratings the switching surge energy absorption capability is 3.4 kJ/kV of U_c -single impulse and 5.3 kJ/kV of U_c -double impulse.

Table 3. Insulation Withstand Voltages

Notes:

1. Refer to Figure 4 for illustrations of dimensions B and C and Figure 8 for dimensions A and D.

* Phase-to-Phase clearances are expressed as minimum arrester center-to-center distances. Phase-to-Earth clearances are expressed as minimum arrester centerline-to-ground distances.

** Leakage distances shown are for standard housing – see page 8, digits 9 & 10 for optional housings available.

UltraQUIK™ Catalog Numbering System for UltraSIL Polymer-Housed VariSTAR Class 2 Arresters

1	U	2															
---	---	---	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

14 = Nameplate information, see figures 6 and 7

Nameplate information is per IEC 60099-4 and is available in the following languages.

Specify:

A = English **B** = Spanish **C** = Portuguese

15 = Packaging

Arresters with housing codes 60 or less are shipped complete, ready for installation. Arresters with housing codes greater than 60 are shipped unassembled, requiring assembly during installation.

A = Export packing, individually packed in cartons – housings 06 through 46.

1 = Export packing, individually packed in cartons – housings 48 and higher.

Nameplate information

A stainless steel nameplate is attached to the base of every UltraSIL Polymer-Housed Type U2 Arrester. The arrester catalog number, serial number, year of manufacture, Ur, Uc, and pressure relief rating are among the details provided on the nameplate. See Figure 5 for an example of a base nameplate. For multi-unit arresters with housing codes greater than 60, an additional nameplate is provided on the base as shown in Figure 6.

Figure 5. Arrester base nameplate (English version).

Figure 6. Detail of unit nameplate on arrester base.

Figure 7.
Base mounting.

Additional information

Table 6.
Product literature

CP0408	Certified Test Report
IS235-96-1	Service and Installation Instruction

Figure 8.
Outline drawing of standard UltraSIL Polymer-Housed VariSTAR Type U2 Surge Arresters.

Notes:

Refer to Table 5 for dimensions A and D. Arresters shown with standard line terminal, Option B in digit 11 (3-108 kV) and Option 4 in digit 11 (120-240 kV) and with standard earth terminal Option 5 in digit 12.

Outlines in Figure 8 represent standard arrester catalog numbers from Table 5. Outline dimensions will vary when optional housing codes are selected from page 8. Consult factory for more information.
